                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Description

Batent No. 6383768

GENERAL INFORMATION:
APPLICANT: DE FRANCESCO, Raffaele
APPLICANT: DEMERANCESCO, Raffaele
APPLICANT: DEMERANCESCO, Raffaele
APPLICANT: DEMERANCESCO, Raffaele
APPLICANT: DEMERANCE Licia
TITLE OF INVENTION: METHOD FOR REPRODUCING IN VITRO THE RNA-DEPENDENT RNA
TITLE OF INVENTION: POLYMERASE AND TERMINAL NUCLECTIDYL TRANSFERASE
TITLE OF INVENTION: ACTIVITIES ENCODED BY HEPATITIS C VIRUS (HCV)
FILE REFERENCE: 170002P
CURRENT APPLICATION NUMBER: US/08/952,981A
CURRENT PAPLICATION NUMBER: 1998-03-23
NUMBER OF SEQ ID NOS: 14
SOFTWARE: PatentIN Ver. 2.0
SEQ ID NO 1
SEQ IN 1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         US-09-315-850-36

Sequence 36, Application US/09315850

Patent No. 6217872

Patent No. 6217872

APPLICANT: PUKE, Isaco

APPLICANT: PUKE, Isaco

APPLICANT: TAKAMIZAWA, Akahisa

APPLICANT: TOSHIDA, Iwao

TITLE OF INVENTION: NON-A, NON-B HEPATITIS VIRUS GENOMIC

TITLE OF INVENTION: DNA AND ANTIGEN POLYPEPTIDE

NUMBER OF SEQUENCES: 50

CORRESPONDENCE ADDRESS:

ADDRESSER: Amaghton

ADDRESSER: Naughton

ADDRESSER: Naughton
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS, Version 5.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ADDRESSER: Naughton

in

The present invention relates to a method for detecting RNA polymerase estivity in a continuous-read manner. The method comprises contacting an RNA polymerase with an oligomucleotide template in a reaction mixture comprising an assay buffer, under conditions in which the RNA polymerase

13-NOV-2002

```
ò
is active, adding a fluorescent dye capable of binding double-stranded nucleic acid molecules to the reaction mixture, and measuring the fluorescence of the reaction mixture. The RNA polymerase is the Hepatitis C virus (HCV) polymerase, NSSB. The method is useful for treating HCV infection, bone mineral diseases like osteoporosis, carcinomas, cardiovascular diseases, diabetes, ocular disorders, renal dysfunction, lymphomas, lymphopoliferative disorders, metabolic disorders, arthritis, sleep disorders and thyroid disorders. The present sequence represents C terminally truncated HCV NSSB polymerase (designated Cdelta21 NSSB).
                                                                                                                                                                                                                                                                                         120
                                                                                                                                                                                                                                                                                                                                                 180

Mutant RNA polymerase MUT-2 protein

30-JAN-2003

```
The invention relates to an isolated, purified nucleic acid molecule, which encodes a mutant hepatitis C virus (HCV) NS5B RNA polymerase, where a point mutation occurs at least at one or all of positions 47, 101, 106, and/or 114 of the native RNA polymerase sequence not defined in the specification. The method of the invention is utilised to identify inhibitors of the polymerase. The inhibitors serving as lead compounds for the design of potentially therapeutic compounds for the treatment of HCV. The mutant HCV NS5B RNA polymerase has improved crystallisation properties as compared to a native HCV NS5B RNA polymerase. This sequence represents a mutant RNA polymerase protein of the invention. NOTE: This sequence is not shown in the specification. It is, however, described in the specification and its sequence has been obtained from an electronic

The invention relates to an isolated, purified nucleic acid molecule, which encodes a mutant hepatitis C virus (HCV) NS5B RNA polymerase, where a point mutation occurs at least at one or all of positions 47, 101, 106, and/or 114 of the native RNA polymerase sequence not defined in the specification. The method of the invention is utilised to identify inhibitors of the polymerase. The inhibitors serving as lead compounds for the design of potentially therapeutic compounds for the treatment of HCV. The mutant HCV NS5B RNA polymerase has improved crystallisation properties as compared to a native HCV NS5B RNA polymerase. This sequence represents a mutant RNA polymerase protein of the invention. NOTE: This sequence is not shown in the specification. It is, however, described in
                                                                                                                                                                                                                                                                                                                                                                                                                                                           245 QCCDLAPEARQAIRSLTERLYVGGPMTNSKGQNCGYRRCRASGVLTTSCGNTLTCYLKAA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated, purified nucleic acid molecule, which encodes a mutant hepatitis C virus (HCV) NS5B RNA polymerase, where a point mutation occurs at least at one or all of positions 47, 101, 106, and/or 114 of the native RNA polymerase sequence not defined in the specification. The method of the invention is utilised to identify inhibitors of the polymerase. The inhibitors serving as lead compounds for the design of potentially therapeutic compounds for the treatment of HCV. The mutant HCV NS5B RNA polymerase has improved crystallisation properties as compared to a native HCV NS5B RNA polymerase. This sequence represents a mutant RNA polymerase protein of the invention. NOTE: This sequence is not shown in the specification. It is, however, described in the specification and its sequence has been obtained from an electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DDHYRDVLKEMKAKASTVKAKLLSVEBACKLTPPHSAKSKFGYGAKDVRSLSSRAVNHIR 124

NSSB RNA h can be

8 셤 ઠે g ò 셤 ð

```
The present invention provides the hepatitis C virus (HCV) NSSB oblymerase protein and its structure. It also provides methods for identifying inhibitors of the protein which can be used in the treatment of HCV infection. HCV can lead to cirrhosis and hepatoma in its chronic
                                                                                     New polypeptide, derived from hepatitis C virus (HCV) polymerase NS5B, having a HCV polymerase activity, useful for crystal structure analysis and for rational identification of HCV polymerase inhibitors.
                                                                                                                                    Disclosure; Page 279-282; 295pp; English

                                                                                                                                                                                                                                                                                                                                                                                                    The sequences given in AAG79556-61 are hepatitis C virus (HCV) decreased affinity NS5B polymerases. These enzymes are used in the method of the invention for identifying a potential inhibitor of the binding between a HCV NS5B RNA-dependent RNA polymerase and an appropriate primer-template. The method comprises incubating the HCV NS5B polymerase with the primer-template. The template in the presence and absence of a potential inhibitor. The HCV NS5B polymerase has a decreased affinity for the primer-template relative to that of native HCV NS5B RNA-dependent RNA polymerase. The method is useful for identifying a potential inhibitor of the binding between a HCV NS5B RNA-dependent RNA polymerase and a primer-template. Use of polymerase constructs having a lower affinity towards the primer-template in that of native NS5B polymerase is particularly useful for identifying potential inhibitors in screening large libraries of compounds. The new method reduces the difficulties and disadvantages of prior art. The present method provides an assay that is easy to perform the control inhibitors that would not be identified as such using native NS5B polymerase. This protein represents a soluble form of mature HCV NS5B polymerase. This protein represents a soluble form of mature HCV NS5B polymerase. This protein represents a soluble form of mature HCV NS5B polymerase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SVWKDLLEDTETPIDTTIMAKNEVFCVQPEKGGRKPARLIVFPDLGVRVCEKWALYDVVS 180

The invention relates to a method for identifying compounds that bind to hepatitis C virus (HCV) polymerase. The method involves (a) treating HCV polymerase, or its analogue, with a probe that binds to the polymerase to form a complex but is displaceable by an inhibitor; (b) measuring a signal emitted from the probe in the complex to establish a baseline value; (c) incubating the complex with test compound; and (d) measuring the signal from the complex and comparing it with the baseline. Any method is used to identify (also to determine potency) of HCV polymerase. The method is used to identify (also to determine potency) of HCV polymerase inhibitors, potentially useful as antiviral agents. The present sequence

The present invention relates to the purification, crystallisation, and structure of hepatitis C virus (HCV) NS5B RNA-dependent RNA polymerase. The composition containing the crystals of HCV NS5B polymerase polypeptide diffracts x-rays for determination of the atomic coordinates of the polypeptide to greater than 4.0 Angstroms resolution. The crystal is useful for determination of the atomic coordinates of the HCV NS5B polypeptide, and is useful in drug screening methods. The present sequence represents a mutant of the published sequence (Genbank Accession No. 130458) for the HCV NS5B polypeptide, His-NS5BdelCT21. This mutant terminus. The C-terminal 21 amino acid substitutions and a polyhistidine tag at the N-terminus. The C-terminal 21 amino acids present in the wild type are also deleted in His-NS5BdelCT21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         126
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           128

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a crystalline composition comprising a hepatitis C virus (HCV) RNA-dependent RNA polymerase NSSB polypeptide. The invention also relates to a composition comprising an NSSB protein having at least one amino acid substitution and a method of preparing purified crystalline HCV NSSB comprising stabilising an NSSB protein preparation in a solution containing a protein stabilising agent, subjecting the NSSB protein preparation to cation exchange chromatography in a buffer containing alycine, and allowing crystals to form in a precipitant containing a protein stabilising agent, a salt and polyethylene glycol under conditions in which crystallisation occurs. The NSSB polypeptide is preferably tNSSB, a truncated NSSB polypeptide. The invention is used to provide a target for discovery of anti-HCV agents. This sequence represents the NSSB polypeptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                ö
                                                                                                                      The invention relates to a novel recombinant Hepatitis C virus (HCV) NSSB protein which is derived from a HCV patient's serum and has excellent RNA dependent RNA polymerase (RdRp) activity. The polypeptide of the invention may be useful as a HCV growth inhibitor. The current sequence is that of the HCV NSSB RNA-dependent RNA polymerase (RdRp) protein of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              544

                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences given in AAG79556-61 are hepatitis C virus (HCV) decreased affinity NS5B polymerases. These enzymes are used in the method of the invention for identifying a potential inhibitor of the binding between a HCV NS5B RNA-dependent RNA polymerase and an appropriate primer-template. The method comprises incubating the HCV NS5B polymerase with the primer-template in the presence and absence of a potential inhibitor. The HCV NS5B polymerase has a decreased affinity for the primer-template relative to that of native HCV NS5B RNA-dependent RNA polymerase. The method is useful for identifying a potential inhibitor of the binding between a HCV NS5B LNA-dependent RNA polymerase. The method is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NSSB RNA-dependent RNA polymerase and a primer-template. Use of polymerase constructs having a lower affinity towards the primer-template than that of native NSSB polymerase is particularly useful for identifying potential inhibitors in screening large libraries of compounds. The new method reduces the difficulties and disadvantages of prior art. The present method provides an assay that is easy to perform on large libraries of compounds, and has improved sensitivity for detecting inhibitors that would not be identified as such using native NSSB polymerase. This protein represents a soluble form of mature HCV NSSB which lacks the C-terminal 57 amino acids and has an C-terminal hexa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  180

Specifically, it refers to a method for diagnosing non-A-non-B type hepatitis patients, as well as for detecting those people who are carriers. The present invention describes a diagnosis method that uses a mepatitis of virus antibody detection reagent and subsequent PCR amplification to identify a clone C260-1 that encodes the non-A-non-B type hepatitis virus antigen sequence. This polypeptide sequence is the.

                                                                                                                                                                                                                                                                          AAR67630 is the structural protein of the Non-A Non-B (NANB) hepatitis virus encoded by a partial cDNA to genomic RNA sequence. Regions of the polypeptide were studied for suitability as an epitope. The novel epitopes are effective in the diagnosis of NANB hepatitis. The nucleotide sequences (see AAQ75817-19) were isolated from the plasma of donors in papan with high sGTP levels, and were found to be different from previously reported NANB hepatitis viruses. The DNA can be used as reagent for detecting the NANB hepatitis viral gene. The polypeptides can be used as reagents for detecting anti-NANB hepatitis antibodies or as a NANB hepatitis viral vaccine. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 27-AUG-2003 to correct OS field.)

Teranishi Y, Hayashi N;

Murakami T,

The sequences given in AAR29871-906 and AAR29533 are encoded by various clones of the NS4-NS5 regions of the Hepatitis C virus (HCV) gene of the invention. These NS4-NS5 RNA sequencess were isolated from the serum of a patient suffering from hepatitis C (HC). The isolated RNA sequences were converted into cDNA using transcriptase in the presence of one of the primer sequences given in AAQ32565-77. The sequences were then amplified using primer pairs. The cDNA sequences isolated represent different calleles of the same region of the HCV gene. Sequence analysis shows that these clones represent the core region and some upstream sequences of HCV. These polypeptides are thought to contain a highly hydrophilic region which can adopt a "turn structure" which is not an alpha helix or a beta sheet. These polypeptides are thought to act as antigen determinants and are highly reactive with antiserum raised against HCV-associated antigens. See also AAQ32436. (Updated on 25-MAR-2003 to
